Data is transmitted from one integrated circuit to another integrated circuit using a differential data transmission scheme. A common mode DQS signal, is a reference of zero voltage. The common mode DQS signal is typically required to be a constant frequency signal or a well-defined DC voltage. This DQS signal is input to each differential pair of data transmitting and receiving circuits on an integrated circuit. The data transmitting and receiving circuits are commonly referred to as “data receiver” and “data driver, 82157476af
